1 Introduction

1.1 About this Manual

This manual describes how to use the EtherNet/IP generic Adapter DTM to configure within a FDT Framework the device parameters of an EtherNet/IP Adapter device. Modular EtherNet/IP Devices can be configured using the modular generic EtherNet/IP Generic Adapter DTM.

To perform the configuration procedure the generic EtherNet/IP Generic Adapter DTM is inserted in a network project to the Master busline of an EtherNet/IP Scanner DTM.

1.1.1 Descriptions of the Dialog Panes

1.2 Legal Notes

1.2.1 Copyright

© Hilscher, 2007-2013, Hilscher Gesellschaft für Systemautomation mbH
All rights reserved.

The images, photographs and texts in the accompanying material (user manual, accompanying texts, documentation, etc.) are protected by German and international copyright law as well as international trade and protection provisions. You are not authorized to duplicate these in whole or in part using technical or mechanical methods (printing, photocopying or other methods), to manipulate or transfer using electronic systems without prior written consent. You are not permitted to make changes to copyright notices, markings, trademarks or ownership declarations. The included diagrams do not take the patent situation into account. The company names and product descriptions included in this document may be trademarks or brands of the respective owners and may be trademarked or patented. Any form of further use requires the explicit consent of the respective rights owner.

1.2.2 Important Notes

The user manual, accompanying texts and the documentation were created for the use of the products by qualified experts, however, errors cannot be ruled out. For this reason, no guarantee can be made and neither juristic responsibility for erroneous information nor any liability can be assumed. Descriptions, accompanying texts and documentation included in the user manual do not present a guarantee nor any information about proper use as stipulated in the contract or a warranted feature. It cannot be ruled out that the user manual, the accompanying texts and the documentation do not correspond exactly to the described features, standards or other data of the delivered product. No warranty or guarantee regarding the correctness or accuracy of the information is assumed.

We reserve the right to change our products and their specification as well as related user manuals, accompanying texts and documentation at all times and without advance notice, without obligation to report the change. Changes will be included in future manuals and do not constitute any obligations. There is no entitlement to revisions of delivered documents. The manual delivered with the product applies.

Hilscher Gesellschaft für Systemautomation mbH is not liable under any circumstances for direct, indirect, incidental or follow-on damage or loss of earnings resulting from the use of the information contained in this publication.
1.2.3 Exclusion of Liability

The software was produced and tested with utmost care by Hilscher Gesellschaft für Systemautomation mbH and is made available as is. No warranty can be assumed for the performance and flawlessness of the software for all usage conditions and cases and for the results produced when utilized by the user. Liability for any damages that may result from the use of the hardware or software or related documents, is limited to cases of intent or grossly negligent violation of significant contractual obligations. Indemnity claims for the violation of significant contractual obligations are limited to damages that are foreseeable and typical for this type of contract.

It is strictly prohibited to use the software in the following areas:

- for military purposes or in weapon systems;
- for the design, construction, maintenance or operation of nuclear facilities;
- in air traffic control systems, air traffic or air traffic communication systems;
- in life support systems;
- in systems in which failures in the software could lead to personal injury or injuries leading to death.

We inform you that the software was not developed for use in dangerous environments requiring fail-proof control mechanisms. Use of the software in such an environment occurs at your own risk. No liability is assumed for damages or losses due to unauthorized use.

1.2.4 Warranty

Although the hardware and software was developed with utmost care and tested intensively, Hilscher Gesellschaft für Systemautomation mbH does not guarantee its suitability for any purpose not confirmed in writing. It cannot be guaranteed that the hardware and software will meet your requirements, that the use of the software operates without interruption and that the software is free of errors. No guarantee is made regarding infringements, violations of patents, rights of ownership or the freedom from interference by third parties. No additional guarantees or assurances are made regarding marketability, freedom of defect of title, integration or usability for certain purposes unless they are required in accordance with the law and cannot be limited. Warranty claims are limited to the right to claim rectification.
1.2.5 Export Regulations

The delivered product (including the technical data) is subject to export or import laws as well as the associated regulations of different counters, in particular those of Germany and the USA. The software may not be exported to countries where this is prohibited by the United States Export Administration Act and its additional provisions. You are obligated to comply with the regulations at your personal responsibility. We wish to inform you that you may require permission from state authorities to export, re-export or import the product.

1.2.6 Registered Trademarks

Windows® XP, Windows® Vista, Windows® 7 and Windows® 8 are registered trademarks of Microsoft Corporation.

EtherNet/IP™ is a trademark of ODVA (Open DeviceNet Vendor Association, Inc).

All other mentioned trademarks are property of their respective legal owners.
1.3 About EtherNet/IP Generic Adapter DTM

You can use the EtherNet/IP generic Adapter DTM to configure the EtherNet/IP Slave devices described with EDS files within a FDT Framework. Modular EtherNet/IP Devices are configured using the modular EtherNet/IP generic Adapter DTM.

The information necessary for the configuration of the EtherNet/IP Slave devices is stored within the EtherNet/IP Scanner device when using the EtherNet/IP generic Adapter DTM and thus the Scanner device is configured.

1.3.1 Requirements

System Requirements

- PC with 1 GHz processor or higher
- Windows® XP SP3, Windows® Vista (32 bit) SP2, Windows® 7 (32 bit) SP1, Windows® 7 (64 bit) SP1, Windows® 8 (32 bit) or Windows® 8 (64 bit)
- Administrator privilege required for installation
- Internet Explorer 5.5 or higher
- RAM: min. 512 MByte, recommended 1024 MByte
- Graphic resolution: min. 1024 x 768 pixel
- Keyboard and Mouse

Note: If the project file is saved and opened again or if it is used on another PC, the system requirements must match. Particularly the DTM must be installed on the used PC.

Restriction

Touch screen is not supported.

Requirements EtherNet/IP Generic Adapter DTM

Requirements for working with the EtherNet/IP generic Adapter DTM are:

- Installed FDT/DTM V 1.2 compliant frame application,
- Installed EtherNet/IP Scanner DTM,
- EDS file of the devices to be configured. The parameters must be set manually according to the EDS file.
- The user needs to reload the Device Catalog
1.4 **Dialog Structure of the EtherNet/IP Generic Adapter DTM**

The graphical user interface of the DTM is composed of different areas and elements listed hereafter:

1. A header area containing the **General Device Information**,
2. The **Navigation Area** (area on the left side),
3. The **Dialog Pane** (main area on the right side),
4. **OK**, **Cancel**, **Apply**, **Help**,
5. The **Status Line** containing information e.g. the online-state of the DTM.

## 2 Getting started and Instructions Step by Step

### 2.1 Overview Configuration Steps

The following overview describes the steps to configure a EtherNet/IP Adapter device with the EtherNet/IP generic Adapter DTM as it is typical for many cases. At this time it is presupposed that the EtherNet/IP Scanner DTM installation was already done.

The overview lists all the steps in a compressed form. For detailed descriptions of each step refer to the sections noted in the column For detailed information see section.

<table>

</tbody>
</table>

Notice the descriptions in the section Overview Configuration Steps on page 14.
3.2 Configuring Adapter Parameters

The following steps are required to configure the parameters of the EtherNet/IP Adapter device using the EtherNet/IP generic Adapter DTM:

(I) In the EtherNet/IP Scanner DTM:

IP Settings for the Adapter Device
1. Make the IP settings for the Adapter device.

(II) In the generic EtherNet/IP Adapter DTM

Modules
2. Configure the modules of the modular EtherNet/IP Adapter (for modular DTM only):
    Select Configuration > Modules in the navigation area.

Electronic Keying
3. Select the electronic keying method and configure if necessary:
    Select Configuration > Electronic Keying in the navigation area.

Connection
4. Configure the connection points:
    Select Configuration > Connection in the navigation area.

Assembly
5. Configure Instance ID and Data length:
    Select Configuration > Assembly in the navigation area.

(III) Configure a Modular Device
6. Configure a modular device according to the description in section Configuration Steps for modular EtherNet/IP Devices on page 29.

Close Adapter DTM Configuration Dialog
7. Click OK in order to close the EtherNet/IP generic Adapter DTM configuration dialog and to store your configuration.

Further Information

For more information refer to section Electronic Keying on page 20, to section Modules (modular DTM) on page 19, to section Connection on page 22 and to section Assembly on page 25 of this document.
3.3 General

The **General** dialog page shows the **Description** of the EtherNet/IP Adapter. The **IP Address** is set by the EtherNet/IP Scanner.

To show the current device settings:

- Select **Configuration > General** in the navigation area.

![Figure 6: Configuration > General](Image)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Symbolic Name of the EtherNet/IP Adapter device.</td>
</tr>
<tr>
<td>IP Address</td>
<td>The IP address of the EtherNet/IP Adapter device is set in the EtherNet/IP Scanner DTM. Here it is only displayed. The EtherNet/IP Scanner device transmits the IP address of the EtherNet/IP Adapter during startup via the EtherNet/IP network to the EtherNet/IP Adapter and thereby configures the EtherNet/IP Adapter.</td>
</tr>
</tbody>
</table>

Table 9: General Pane Parameters
3.4 Modules (modular DTM)

In the EtherNet/IP modular generic Adapter DTM at the Modules pane the modules of the modular EtherNet/IP Adapter can be configured.

- Select Configuration > Modules in the navigation area.

</tr>
</tbody>
</table>

Table 10: Modules Pane Parameters
3.5 Electronic Keying

The concept of Electronic Keying was introduced by Allen-Bradley, RA. EtherNet/IP scanner implements compatible concept.

A set of attributes of an EtherNet/IP Adapter can be regarded as its electronic identity which can be used to differentiate adapters based on these attributes. EtherNet/IP scanner employs this electronic identity to build an Electronic Key and uses it to verify that an adapter connected to the network is the expected one. Electronic keying allows flexible online validation of adapters, provides a method for reliable network configuration.

Attributes of the electronic identity that can be used in keying are as follows: Minor Revision, Major Revision, Product Code, Product Type and Vendor ID.

➢ Select Configuration > Electronic Keying in the navigation area.

![Figure 8: Configuration > Electronic Keying](image)

![Figure 9: Configuration > Electronic Keying (modular DTM)](image)
➢ Select a Module (modular DTM only).

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select module (modular DTM only)</td>
<td>For modular EtherNet/IP Adapter first in the modular generic Adapter DTM a module must be selected to parameterize the electronic keying parameters.</td>
</tr>
</tbody>
</table>

*Table 11: Electronic Keying > Select module*

➢ Select a **Keying method**.

<table>
<thead>
<tr>
<th>Method</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exact match</td>
<td>To validate an EtherNet/IP adapter connected to the network all attributes for the electronic identity must correspond to the attributes of an expected device.</td>
</tr>
<tr>
<td>Custom keying</td>
<td>To validate an EtherNet/IP adapter connected to the network all attributes must correspond to the configured keying.</td>
</tr>
<tr>
<td>No keying</td>
<td>No validation of the device identity.</td>
</tr>
</tbody>
</table>

*Table 12: Electronic Keying > Keying Method*

For Custom Keying:

➢ Select **Custom Keying** and configure the keying attributes.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relaxed Match</td>
<td>If checked: Restricted validation of the electronic identity for devices. To indicate relaxed match to an adapter, the scanner sets bit 7 in major revision.</td>
</tr>
<tr>
<td>Match minor Revision</td>
<td>If checked: For electronic keying consistency to minor revision is relevant and gets verified.</td>
</tr>
<tr>
<td>Match major Revision</td>
<td>If checked: For electronic keying consistency to major revision is relevant and gets verified.</td>

---

*Note:* The max. process IO data length depends on existence of run/idle header (O2T, T2O) and SizeAdder byte length (T2O only).

*Figure 11: Configuration > Connection, display including SizeAdder (modular DTM). If SizeAdder is not defined, the max. process IO data length depends on existence of run/idle header (O2T, T2O) only*

*Note:* For slot <0> (communication module) there is no Size Adder, for other slots (set modules) there are.

---

</tbody>
</table>

**Run/Idle Mode for Realtime Transfer Format**

The Run/Idle header is a 32-bit field added to packets flowing in the O2T or T2O direction. In O2T direction it contains several bits of status info. Of primary interest is the least significant bit, which reflects the mode of the connection originator. When this bit is set it means the originator is in Run mode, actively controlling I/O. When cleared this indicates that the originator is in Idle mode, not actively controlling the I/O. Run/Idle is not counted as part of the configured data size in the EDS Connection Manager section. It is counted in the FwdOpen Message O2T and T2O sizes however.

**SizeAdder**

There could be size adder defined in the adapter EDS file. "ProxyParamSizeAdder" keyword shall be used to provide minimum, maximum and default values to be added to the "ProxyParam" minimum, maximum and default values. "ProxyParamSizeAdderN" shall be combined with the corresponding "ProxyParamN" entry. The "ProxyParamSizeAdder" keyword provides a means for an adapter on a module connection ("ProxyConnect") to add adapter data to the module data and return the combined data on the connection. For more details, refer to [2], chapter 7-3.7.2.2.

**Note:** If Size Adder is described in the adapter EDS file, it should be always set to default value.
3.7 Assembly

The **Assembly** dialog page shows the list of all input or output connections configured to the EtherNet/IP Adapter.

Please, refer to chapter *Configuring a modular EtherNet/IP Adapter* in this document explaining modular EDS concept and usage.

![Configuration > Assembly](image1.png)

**Figure 12: Configuration > Assembly**

**EtherNet/IP Modular Generic Adapter DTM:**

![Configuration > Assembly (modular DTM)](image2.png)

**Figure 13: Configuration > Assembly (modular DTM)**
## Parameter | Meaning | Range of Value / Value
---|---|---
Select module (modular DTM only) | For modular generic Adapter a module must be selected to parameterize module's connection. |  |
IN/OUT/CFG | Input/Output/Config. connection point |  |
Connection name | Name of the connection configured to the EtherNet/IP Adapter |  |
Instance ID | Instance ID of the connection (editable) | 1-255 |
Data length | Data length in Bytes (editable) |  |
Min. length (IN, OUT, CFG) | Minimum data length in Bytes | 0 |
Max. length (IN, OUT) | Maximum data length in Bytes |  |
For the IO messaging there are 511 Bytes max., 9-Bit CIP Container Length, available.  
Apart from process IO data, the CIP message contains:  
-1- CIP Counter, 2 Bytes, always  
-2- Real-Time Header (32-bit Run/Idle Header) 4 Bytes, if configured (for each direction)  
-3- SizeAdder Bytes (according to module EDS) in modular Adapters, for T2O direction, if available.  
Hence, the max. Assembly Instance data length is calculated as follows:  
\[
Max\_\_Data\_Len = 509 - \text{sizeof( run\_time\_header) - sizeof( module\_SizeAdder)}  
\]
\[
= 509 \text{ Bytes (Max. avail.) - 2 Bytes CIP Counter (always)}  
\]
\[
= \text{sizeof( run\_time\_header) = 4 Bytes if configured, 0 Bytes else.}  
\]
\[
= \text{sizeof( module\_SizeAdder) = n Bytes (EDS) if available for T2O direction.}  
\]
\[
= \text{For O2T it is always 0 Bytes.}  
\]
Max. length (CFG) | Maximum data length in Bytes | 400 |
Cfg.#1 data segment | Configuration data segment 1 |  |
Cfg.#2 data segment | Configuration data segment 2 |  |
Import ... | The data segment configuration file can be imported. |  |

*Table 15: Parameters Dialog Page Assembly*
4 Configuring a modular EtherNet/IP Adapter

4.1 Requirements

In order to be able to configure a modular EtherNet/IP Adapter with the Modular Generic Adapter DTM, some EDS knowledge is required as the DTM does not come with an EDS parser for this purpose.

Along with the Chassis, the Adapter Module and the I/O Modules EDS files and printed data sheets for them are delivered.

**Required Electronic Data Sheets are:**
1. Chassis EDS
2. Adapter Module's EDS
3. I/O Modules’ EDS

**Required Knowledge:**
- To the concept for Proxying
- To the implementation methods of modular devices with configurable parameters
- To the relationship between adapter module and I/O modules

If you’re using modular devices with configurable parameters, you must be familiar with their implementation methods and understand configurable parameters relationship between the adapter module and the I/O modules.
4.1.1 Overview - Configuring Adapter Module and I/O Modules

In EtherNet/IP Modular Generic Adapter DTM the used Adapter Module and I/O Modules must be configured.

- **Configure Adapter Module**
  1. In the Adapter Module EDS (Electrical Data Sheet) select a connection from the [Connection Manager] section.
  2. Setting the Connection Parameters and the I/O and Configuration Assembly Information in the DTM.
     - Use the connection parameters and the I/O and configuration assembly information from the Adapter Module’s EDS, according to the settings in the selected connection.
  3. Omitte step 2, if it is not necessary to configure the connection for the Adapter Module.

Or:

- **Configure an I/O Module**
  1. In the I/O Module’s EDS select a connection from the [Connection Manager] section.
     - Always selected connection: ProxiedConnectionN.
  2. Setting the Connection Parameters and the I/O and Configuration Assembly Information in the DTM.
     - Use the connection parameters and I/O and configuration assembly information from the I/O Module’s and the Adapter Module’s EDS, according to the concept for Proxying for modular EDS files.

- **Parameters for Adapter and/or I/O Modules**
  For parameters for the Adapter and/or the I/O Modules use EDS default settings or values in the given range. These settings are required for the O2T/T2O data length and/or config. #1,#2 parts of the connections.
  (O2T: Originator to Target; T2O: Target to Originator)

  **Note:** EtherNet/IP Generic Adapter DTM doesn’t support configuration using parameter objects or parameter object stubs embedded within the device!

  **Remark:** For successfull configuring the device use the EtherNet/IP Modular Generic Adapter DTM and the device’s EDS file.
4.2 Configuration Steps for modular EtherNet/IP Devices

![Diagram: Parameterizing a modular EtherNet/IP Device]

*Figure 14: Parameterizing a modular EtherNet/IP Device*
4.3 Modular EDS files

Modular EDS files are used for modular devices description. An EtherNet/IP modular Device consists of a network adapter known as adapter module with network connection and pluggable I/O modules. The latter can only be communicated using the network adapter module.

Each adapter and pluggable I/O, comes with its own module EDS file.

Chassis have their own EDS files. From the Chassis EDS file, the [Params] section is of interest and the value of DefineSlotsInRack, the number of slots.

The concept for Proxying has been introduced for pooling of distributed configuration information needed to get the whole device configured and running.

4.3.1 The Concept for Proxying

EtherNet/IP allows direct module connections. The Scanner device needs information how to get/set the data from/to a specific I/O module in the rack. As an Ethernet connection only is established to the network adapter module, the module connections have to be done via the adapter module. On the other hand, the adapter module does not have information to the characteristics of a pluggable I/O module. This information the Adapter Module gets from the Modular EDS files and with help of the concept for Proxying.

To describe the modular device’s network characteristics, regarding available connections, the configuration parameters and assemblies, the adapter module’s EDS file and the I/O modules’ EDS file must be evaluated together.

The concept for Proxying allows distributed description of the configuration information, each module has its own EDS file.

The prefixes Proxy and Proxied are used to create a link between [Params][Assembly][Connection Manager] sections in different EDS files. The Proxy prefix is used in the adapter module’s EDS file, the Proxied prefix in the I/O modules EDS file. So, for example, the “ProxyConnect1” entry in the adapter EDS file has it’s corresponding “ProxiedConnect1” entry in the I/O modules EDS file. Zipping method is used to get complete Assembly, Param or Connect description. Combining “ProxyConnect1” with “ProxiedConnect1” results in a full description of the direct Connect1 module connection available to the network.
4.3.2 Rehearse a Configuration by means of Genuine Modular EDS files

- **Example Adapter Data**

  For demonstration purpose here serve the EDS files for 1794-AENT Adapter, 1794-OB16 and 1794-IB16 pluggable modules. For complete EDS listings, please, refer to the online resource [http://www.ab.com/networks/eds.html](http://www.ab.com/networks/eds.html)

<table>

*Table 16: Example Adapter Data*

- **Assembling physical Device**

  1. Assemble a device using the modules mentioned above in a compatible chassis, according to the RackN entries in the [Modular] section in Modules' EDS files.

- **Guidance for Configuration**

  2. Follow the descriptions given in the subsequent sections to perform the necessary configuration steps.

- **Configuration Task**

  The configuration task is to configure connections to different modules in a rack.

- **Sample Modules**

  As sample the two I/O modules and a network module mentioned above are used.

- **Used Connection**

  The [Connection Manager] section of the adapter and I/O module EDS file specifies which connection from the available ones are to be used in the configuration.
4.3.3 Configuring Modules

- **Configuration Steps**

1. Setting the physical device configuration in the DTM:

   The modules configuration set in the backplane must be configured in the DTM.

   - In the DTM on the **Modules** page set the slot numbers, the module names and the module widths according to the configuration of the physical device, the Flex I/O backplane.

2. Setting slot, module width and module name:

   The adapter EDS file indicates that the 1794-AENT module is plugged in slot 0. The physical device assembly in the sample here must include this.

   - Set in the raw with slot 0 the values: 1 for the *Width* and "**1794-AENT FLEX I/O Ethernet Adapter**" or simply "**1794-AENT**" for the *Module name*.

   **Note:** The module name isn’t used in the communication. It is only used for convenience. Thus shorter denomination for a module can be used.

   If the 1794-IB16/A module physically is plugged into slot 1:

   - Set in the next raw *Slot* to 1, *Width* to 1 and the *Module name* to "**1794 - 16 Point 24V DC Input, Sink**".

   If the 1794-OB16/A module physically is plugged into slot 2:

   - Set in the next raw *Slot* to 2, *Width* to 1 and the *Module name* to "**1794 - 16 Point 24V DC Output, Source**".
4.3.4 Configuring 1794-IB16/A Flex module

4.3.4.1 Selecting Connection

For the 1794-IB16 module the EDS file entry pair "ProxyConnect1+ProxiedConnect1" has been chosen.

"ProxyConnect1" is described in the 1794-AENT Adapter EDS file:

ProxyConnect1 =

0x4010002, $ trigger & transport
0-15 = supported transport classes (class 1)
16 = cyclic (1 = supported)
17 = change of state (0 = not supported)
18 = on demand (0 = not supported)
19-23 = reserved (must be zero)
24-27 = exclusive owner
28-30 = reserved (must be zero)
31 = client 0 (don't care for classes 0 and 1)

0x44240405, $ point/multicast & priority & realtime format
0 = O=>T fixed (1 = supported)
1 = O=>T variable (0 = not supported)
2 = T=>O fixed (1 = supported)
3 = T=>O variable (0 = not supported)
4-7 = reserved (must be zero)
8-10 = O=>T header (4 byte run/idle)
11 = reserved (must be zero)
12-14 = T=>O header
15 = reserved (must be zero)
16-19 = O=>T point-to-point
20-23 = T=>O multicast
24-27 = O=>T scheduled
28-31 = T=>O scheduled

,ProxyParam7,ProxyAssem3, $ O=>T default,description
,ProxyParam1,Assem5, $ T=>O default,description
,Assem3, $ config part 1 (dynamic assemblies)
,ProxyAssem5, $ config part 2 (module configuration)
"Exclusive Owner", $ connection name
"", $ Help string

"01 SLOT_MINUS_ONE 20 04 24 03 2C 01 2C 02"; $ exclusive owner path
“ProxiedConnect1” is described in the 1794-IB16 EDS file:

```
ProxiedConnect1 = 0x00000000,
0x00000000,
, , , $ O=>T
, , , $ T=>O
, , $ Config #1
, , $ Config #2
"",
"",
"";
```

4.3.4.2 Trigger & Transport Configuration

**Note:** Scanner firmware supports only **cyclic** Trigger Mode.

In the “**ProxyConnect1**” key definition the entry

```
0x04010002, $ trigger & transport
```

defines in the bits 24-27 the transport type as **exclusive owner**, bit 26 is set.

- Set Transport Type to “exclusive owner”.

For Trigger & Transport details, refer to [2], Chapter 7-3.6.9.1.

4.3.4.3 Connection Type Configuration

In the “**ProxyConnect1**” key definition the entry:

```
0x44240405, $ point/multicast & priority & realtime format
```

defines in the bits 16-19, O2T connection type as **POINT2POINT**, bit 18 is set.

- In the DTM chose in the configuration **POINT2POINT** for the O2T connection.

The bits 20-23 define T2O connection type as **MULTICAST**, bit 21 is set.

- In the DTM set T2O connection type to **MULTICAST**.

For Connection Type details, refer to [2], Chapter 7-3.6.9.2.
4.3.4.4 Real-time Transfer Format Configuration

In the “ProxyConnect1” key definition the entry

```
0x44240405,    $ point/multicast & priority & realtime format
```

defines in the bits 8-10, the O2T header, value 100h = 4 bytes. The modules “ProxiedConnect1” key definition doesn’t add any information to it.

- Configure Run/Idle header for the O2T connection.
  In the bits 12-14, the T2O header, value 000h = 0 bytes is set. No additional info is available in “ProxiedConnect1”.
  - For the T2O set RTT format to “connection is pure data and is modeless”.

For RTT Format details, refer to [2], Chapter 7-3.6.9.2.

4.3.4.5 Specifying Cfg., O2T & T2O Instance IDs

Adapter EDS defines the connection path in ProxyConnect1 as:

```
"01 SLOT_MINUS_ONE 20 04 24 03 2C 01 2C 02"; $ exclusive owner path
```

20 04 is an Assembly Object Class, followed by the Instance for configuration 24 03, Instance ID 3, optional O2T Connection Point 2C 01, Instance ID 1, and optional T2O Connection Point 2C 02, Instance ID 2.

- Set these IDs for the selected module on the dialog page Assembly in the DTM.

For Module connections the connection path is extended with SLOT_MINUS_ONE, where the SLOT is the slot number of the module.
4.3.4.6 Specifying O2T & T2O Data Rate

RPI in this “ProxyConnect1” connection for both directions is not specified, the I/O module EDS does not add any further restrictions in “ProxiedConnect1” either. This means that the full range of RPI is available.

RPIs are set in the Scanner DTM, Scanlist page, for each connection separately.

4.3.4.7 Specifying O2T Data Size

In ProxyConnect1 there’s an entry:

```
,ProxyParam7,ProxyAssem3, $ O=>T default,description
```

<table>
<thead>
<tr>
<th>Adapter EDS</th>
<th>I/O Module EDS</th>
</tr>
</thead>
<tbody>
<tr>
<td>ProxyParam7 = 0,</td>
<td></td>
</tr>
<tr>
<td>0x0000,</td>
<td></td>
</tr>
<tr>
<td>0xC7,2,</td>
<td></td>
</tr>
<tr>
<td>&quot;output size&quot;,&quot;,&quot;&quot;,&quot;&quot;,</td>
<td></td>
</tr>
<tr>
<td>Module,Module,Module,</td>
<td></td>
</tr>
<tr>
<td>0,0,0,0,</td>
<td></td>
</tr>
<tr>
<td>...;</td>
<td></td>
</tr>
<tr>
<td>0;</td>
<td></td>
</tr>
<tr>
<td>ProxiedParam7 = 0,</td>
<td></td>
</tr>
<tr>
<td>0x0000,</td>
<td></td>
</tr>
<tr>
<td>0&quot;;</td>
<td></td>
</tr>
<tr>
<td>&quot;output size&quot;,&quot;&quot;,&quot;&quot;,</td>
<td></td>
</tr>
<tr>
<td>0,0,0,</td>
<td></td>
</tr>
<tr>
<td>...;</td>
<td></td>
</tr>
<tr>
<td>...;</td>
<td></td>
</tr>
</tbody>
</table>

Table 17: Adapter and I/O Module EDS

The Adapter defines the channel size as 2 bytes, see “ProxyParam7”, but the I/O module’s EDS defines min, max, default values all zero, see “ProxiedParam7”. This is a pure input module. The O2T data size (Output Assembly Instance size) is 0.
4.3.4.8 Specifying T2O Data Size

In ProxyConnect1 there's an entry:

```
,ProxyParam1,Assem5, $ T=>O default,description
```

<table>
<thead>
<tr>
<th>Adapter EDS</th>
<th>I/O Module EDS</th>
</tr>
</thead>
<tbody>
<tr>
<td>ProxyParam1 = 0, . . . , 0x0000, 0xC7, 2, &quot;input size&quot;,...)</td>
<td>ProxiedParam1 = 0, . . . , 0x0000, &quot;input size&quot;, 2, 4, 4, 2, 4, 4, ...</td>
</tr>
<tr>
<td>Module,Module,Module, 0,0,0,0,...,0;</td>
<td></td>
</tr>
</tbody>
</table>
4.3.4.9 Specifying Cfg.#1,#2

In “ProxyConnect1” Assem3 defines the format of Cfg.#1.

...,
Assem3, $ config part 1 (dynamic assemblies)
...

Here a closer look at the Assem3 definition:

Assem3 = "private config",,,,,,  
  16,Param29, $ configuration revision  
  16,0x0002, $ size of output data  
  16,Param30, $ output assembly, width  
  16,0x0c7d, $ output assembly, class/attribute  
  16,0x0004, $ size of input data  
  16,Param31, $ input assembly, width  
  16,0x0a7d, $ input assembly, class/attribute  
  16,Param32, $ status assembly, width  
  16,0x0b7d, $ status assembly, class/attribute  
  16,Param33, $ size of config data  
,ExternalID, $ module key  
16,ProxyAssem7,$ idle action, fault action, automatch,  
  fault from idle, hold last input,  
  not used  
16,ProxyParam3, $ input class size  
16,ProxyParam4, $ status class size  
16,ProxyParam5, $ output class size  
16,ProxyParam6; $ config class size

Cfg Data Segment is made up of

- cfg. revision -
- Output Data Section -
- Input (+status) Data Section -
- Cfg. Data Section -

For the decoding of Assem3 entries, consult [2], Chapter 7: Electronic Data 
Sheets”, chapter ” 7-3.6.7.2.7 Member Size/Member Reference Fields”.
Cfg.#1 is composed of:

01 00 Configuration Revision (Param29)

02 00 Size of Output Data Section (in 16-bit words) ::next 2 words
00 00 Output Assembly Width (bits), pure input module
7D 0C Output Assembly Class/Attrib

04 00 Size of Input Data Section (in 16-bit words) ::next 4 words
10 00 Input Assembly Width (T->O (Input) data size in bits = 16)
7D 0A Input Assembly Class/Attrib
30 00 Status Assembly Width (Param32+SizeAdder = 16+32 = 48* bits)
7D 0B Status Assembly Class/Attrib

07 00 Size of Cfg data (Param33 = Cfg Data Size) ::next 7 words
81 02 Module Key: (From EDS=ExternalID=ProxiedParam2)
00 00 Module Flags: (ProxyAssem7 = Module Flag Data)
01 00 Input Class Size (ProxyParam3 = Module Input Size = 1 words)
01 00 Status Class Size(ProxyParam4 = Module Status Size = 1 words)
00 00 Output Class Size(ProxyParam5 = Module Output Size = 0 words)
01 00 Config Class Size(ProxyParam6 = Module Config Size = 1 words)
00 00 Cfg.#2, module cfg

* - 48 bits of status assembly width are made up of 2 bytes given in Param32 and 4 additional bytes of size adder.

Cfg.#1 data segment value should be set to “0100 0200 0000 7D0C 0400 1000 7D0A 3000 7D0B 0700 8102 0000 0100 0100 0000″.
The Cfg.#2 is defined as:

,ProxyAssem5, $ config part 2 (module configuration)

<table>
<thead>
<tr>
<th>Adapter EDS</th>
<th>I/O Module EDS</th>

"", $ help string
0,7,0, $ min,max,default data values
0,0,0,0, $ mult,dev,base,offset scaling not used
0,0,0,0, $ mult,dev,base,offset link not used
0; $ decimal places not used
Enum1 =
  0, "On->Off/Off->On= 0.25 ms",
  1, "On->Off/Off->On= 0.5 ms",
  2, "On->Off/Off->On= 1 ms",
  3, "On->Off/Off->On= 2 ms",
  4, "On->Off/Off->On= 4 ms",
  5, "On->Off/Off->On= 8 ms",
  6, "On->Off/Off->On= 16 ms",
  7, "On->Off/Off->On= 32 ms";

- Set for these 3 bits EDS default 0, marked red.
- Then "Points 0-11 Input Filter Time" is set to 0.25ms.

Param2 = 0,          $ first field shall equal 0
      ,,,          $ path size,path
     0x0000,     $ descriptor - read only
     2,          $ data type : 16-bit Unsigned Integer
     2,          $ data size in bytes
    "Points 12-15 Input Filter Time", $ name
    ",",          $ units
    ",",          $ help string
  0,7,0,         $ min,max,default data values
  0,0,0,0,       $ mult,dev,base,offset scaling not used
  0,0,0,0,       $ mult,dev,base,offset link not used
  0;          $ decimal places not used

Enum2 =
  0, "On->Off/Off->On= 0.25 ms",
  1, "On->Off/Off->On= 0.5 ms",
  2, "On->Off/Off->On= 1 ms",
  3, "On->Off/Off->On= 2 ms",
  4, "On->Off/Off->On= 4 ms",
  5, "On->Off/Off->On= 8 ms",
  6, "On->Off/Off->On= 16 ms",
  7, "On->Off/Off->On= 32 ms";

- Set for these 3 bits EDS default 0, marked red.
- Then "Points 12-15 Input Filter Time" is set to 0.25ms.
The next 6 bits aren't specified.

- Set next 6 bits to 0.

```

1, $ data size in bytes
"Counter Enable/Disable", $ name
", $ units
", $ help string
0,1,0, $ min,max,default data values
0,0,0,0, $ mult,dev,base,offset scaling not used
0,0,0,0, $ mult,dev,base,offset link not used
0; $ decimal places not used
Enum3 =
0,"Enabled",
1,"Disabled";
```

- Set the following 1 bit to default 0, marked red.

- Then "Counter Enable/Disable" is set to "Enabled".

```
Param4 =
0, $ first field shall equal 0
,, $ path size,path
0x0000, $ descriptor - read only
4, $ data type : 8-bit Unsigned Integer
1, $ data size in bytes
"Filter Enable/Disable", $ name
", $ units
", $ help string
0,1,0, $ min,max,default data values
0,0,0,0, $ mult,dev,base,offset scaling not used
0,0,0,0, $ mult,dev,base,offset link not used
0; $ decimal places not used
Enum4 =
0,"Enabled",
1,"Disabled";
```
- Set the following 1 bit to default 0, marked red.
- Then "Filter Enable/Disable" is set to "Enabled".

The last 2 bits of the 16 bit word aren't specified, we set them to zero.
- Set the last 2 bits of the 16 bit word to 0.

**Note:** `ProxyAssem6` is module's "safe state" data, which is empty. Do not configure it.

- Set `module config`. 16 bits as follows: ...
  00 00 Cfg.#2, module cfg
  (in the example here).
- Set the Cfg.#2 data segment value to “0100 0000”.
4.3.5 Configuring 1794-OB16/A Flex module

4.3.5.1 Selecting Connection

For the 1794-OB16 module the EDS entry pair “ProxyConnect1+ProxiedConnect1” has been chosen.

“ProxyConnect1” is described in the 1794-AENT Adapter EDS, see corresponding listing (EDS snippet) above, in the section for the 1794-IB16 module.

“ProxiedConnect1” is described in the 1794-OB16 Adapter EDS file:

\[
\text{ProxiedConnect1} = \begin{array}{c}
0x00000000, \\
0x00000000, \\
, , , , \$ O=>T \\
, , , , \$ T=>O \\
, , \$ Config \#1 \\
, , \$ Config \#2 \\
"", \\
"", \\
""
\end{array}
\]

4.3.5.2 Trigger & Transport Configuration

**Note:** Scanner firmware supports only cyclic Trigger Mode.

In the “ProxyConnect1” key definition the entry

\[
0x04010002, \$ \text{trigger & transport}
\]

defines in the bits 24-27 the transport type as exclusive owner, bit 26 is set.

➢ Set the Transport Type to “exclusive owner”.

For Trigger & Transport details, refer to [2], Chapter 7-3.6.9.1.
4.3.5.3 Connection Type Configuration

In the “ProxyConnect1” key definition the entry
0x44240405, $ point/multicast & priority & realtime format
defines in the bits 16-19, O2T connection type as POINT2POINT, bit 18 is set.

➢ So in the DTM chose in the configuration POINT2POINT for the O2T connection.

The bits 20-23 define T2O connection type as MULTICAST, bit 21 is set.
➢ In the DTM set T2O connection type to MULTICAST.

For Connection Type details, refer to [2], Chapter 7-3.6.9.2.

4.3.5.4 Real-time Transfer Format Configuration

In the “ProxyConnect1” key definition the entry
0x44240405, $ point/multicast & priority & realtime format
defines in the bits 8-10, the O2T header, value 100h = 4 bytes. The modules “ProxiedConnect1” key definition doesn’t add any information to it.

➢ Configure Run/Idle header for the O2T connection.

In the bits 12-14, T2O header, value 000h = 0 bytes is set and no additional info is available in “ProxiedConnect1”.

➢ So for the T2O connection set RTT format to “connection is pure data and is modeless”.

For RTT Format details, refer to [2], Chapter 7-3.6.9.2.

4.3.5.5 Specifying Cfg.,O2T & T2O Instance IDs

The Adapter EDS defines the connection path in ProxyConnect1 as:

"01 SLOT_MINUS_ONE 20 04 24 03 2C 01 2C 02"; $ exclusive owner path

20 04 is an Assembly Object Class, followed by the Instance for configuration 24 03, Instance ID 3, optional O2T Connection Point 2C 01, Instance ID 1, and optional T2O Connection Point 2C 02, Instance ID 2.

➢ Set these IDs for the selected module on the dialog page Assembly in the DTM.

For Module connections the connection path is extended with SLOT_MINUS_ONE, where the SLOT is the slot number of the module.
4.3.5.6 Specifying O2T & T2O Data Rate

RPI in this “ProxyConnect1” connection for both directions is not specified. The I/O module EDS does not add any further restrictions in “ProxiedConnect1” either. This means that the full range of RPI is available.

RPIs are set in the Scanner DTM, Scanlist page, for each connection separately.

4.3.5.7 Specifying O2T Data Size

In ProxyConnect1 there’s an entry

,ProxyParam7,ProxyAssem3, $ O=>T default,description

<table>
<thead>
<tr>
<th>Adapter EDS</th>
<th>I/O Module EDS</th>
</tr>
</thead>
<tbody>
<tr>
<td>ProxyParam7 = 0,</td>
<td>ProxiedParam7 = 0,</td>
</tr>
<tr>
<td>, , , , , , , 0x0000,</td>
<td>, , , , , , , 0x0000,</td>
</tr>
<tr>
<td>0xC7,2,</td>
<td>, , , , , , , &quot;output size&quot;,&quot;&quot;,&quot;,&quot;&quot;,</td>
</tr>
<tr>
<td>Module,Module,Module,</td>
<td>Module,Module,Module,</td>
</tr>
<tr>
<td>0,0,0,0,0,</td>
<td>0,0,0,0,</td>
</tr>
<tr>
<td>, , , , , , , , , , , , , , , , , , , , , ,</td>
<td></td>
</tr>
</tbody>
</table>

Table 20: Adapter and I/O Module EDS

“ProxyParam7”+”ProxiedParam7” defines the O2T data size as exactly 2 bytes. There’s only one channel and it is 2 bytes long.

- Set the O2T data size (Output Assembly Instance size) to 2.

The ForwardOpen Message O2T data size (packet size) is larger than the I/O data size because the O2T packet always includes the CIP Sequence Count (2 bytes) and if configured, the 32-bit Run/Idle Header (4 bytes).

The ForwardOpen Message O2T data size so could be 4 or 8 bytes depending on run/idle header configuration.

In this example here the ForwardOpen Message O2T data size is 8 bytes as the Run/Idle header (4 bytes) is used.
4.3.5.8 Specifying T2O Data Size

In ProxyConnect1 there’s an entry:

```
,ProxyParam1,Assem5, $ T=>O default,description
```

<table>
<thead>
<tr>
<th>Adapter EDS</th>
<th>I/O Module EDS</th>
</tr>
</thead>
<tbody>
<tr>
<td>ProxyParam1 = 0,</td>
<td>ProxiedParam1 = 0,</td>
</tr>
<tr>
<td>,</td>
<td>,</td>
</tr>
<tr>
<td>0x0000,</td>
<td>0x0000,</td>
</tr>
<tr>
<td>0xC7,2,</td>
<td>,</td>
</tr>
<tr>
<td>&quot;input size&quot;,</td>
<td>&quot;input size&quot;,</td>
</tr>
<tr>
<td>&quot;,&quot;,&quot;&quot;,</td>
<td>=&quot;,&quot;,&quot;&quot;,</td>
</tr>
<tr>
<td>Module,Module,Module,</td>
<td>2,2,2,</td>
</tr>
<tr>
<td>0,0,0,0,, ,,</td>
<td>,, ,, ,</td>
</tr>
<tr>
<td>0;</td>
<td>;</td>
</tr>
</tbody>
</table>

Table 21: Adapter and I/O Module EDS

The range of the T2O data size is defined in "ProxiedParam1" as exactly 2 bytes. So there’s only one channel that is 2 bytes long, see "ProxyParam1".

In the adapter EDS file size adder is defined - 4 bytes minimum, 4 bytes maximum and 4 bytes default, see “ProxyParamSizeAdder1”.

- Use always the default value, marked red in this EDS snippet.
- In the DTM on the Connection page set T2O size adder exactly to 4 Bytes.

```
ProxyParam1 = . . . ;
ProxyParamSizeAdder1 = 4,4,4;
```

The Adapter configuration should indicate to the Scanner that the module input data will consist not only of configured 2 input bytes, but there will be additional 4 bytes the adapter adds to the input packet.

- In the Connection Page set T2O Size Adder to 4.

The Input Data Section (Packet) is 8 bytes long as 2 bytes input data, 4 bytes size adder and 2 bytes CIP sequence counter are available.
4.3.5.9 Specifying Cfg.#1,#2

In “ProxyConnect1” Assem3 defines the format of Cfg.#1.

```
   Assem3,                   $ config part 1 (dynamic assemblies)
   ...                      ...
```

The Cfg Data Segment sections have been described above. A listing for Assem3 is also available above, see section Specifying Cfg.#1,#2 on page 38.

Cfg.#1 is composed of:

```
01 00 Configuration Revision (Param29)

02 00 Size of Output Data Section (in 16-bit words) ::next 2 words
10 00 Output Assembly Width (bits) (Param30=O->T(Output) data size: 16 bits)
7D 0C Output Assembly Class/Attrib (class/attrib ids of data consumer)

04 00 Size of Input Data Section (in 16-bit words) ::next 4 words
00 00 Input Assembly Width (Param31 = T->O (Input) data size: 0 bits)
7D 0A Input Assembly Class/Attrib (class/attrib ids of data producer)
30 00 Status Assembly Width (Param32+SizeAdder = 16 bits + 32 bits = 48)
7D 0B Status Assembly Class/Attrib (class/attrib ids of data producer)

08 00 Size of Config data (Param33 = Config Data Size) ::next 8 words
91 01 Module Key: (From EDS=ExternalID=ProxiedParam2)
20 00 Module Flags: (ProxyAssem7 = Module Flag Data)
00 00 Input Class Size (ProxyParam3 = Module Input Size = 0 words)
01 00 Status Class Size (ProxyParam4 = Module Status Size = 1 words)
01 00 Output Class Size (ProxyParam5 = Module Output Size = 1 words)
02 00 Config Class Size (ProxyParam6 = Module Config Size = 2 words)
00 00 Cfg.#2, module cfg
00 00 Cfg.#2, module flags
```

- Set Cfg.#1 data segment value to “0100 0200 1000 7DOC 0400 0000 7D0A 3000 7D0B 0800 9101 2000 0000 0100 0100”.
The Cfg.#2 is defined as

```
,ProxyAssem5,    5 config part 2 (module configuration)
```

<table>
<thead>
<tr>
<th>Adapter EDS</th>
<th>I/O Module EDS</th>
</tr>
</thead>
</table>
| ProxyAssem5 = "module config and safe state", ..,
  .. Module,;
  ,ProxyAssem1, 
  ,ProxyAssem6; | ProxiedAssem5 = "module config and safe state", ..;
| ProxyAssem1 = "module config",
  "20 7D 24 SLOT 30 0D",
  ,Module,,

  1, Param34; |

Table 22: Adapter and I/O Module EDS
ProxyAssem1 is “module config”, which is 16 bits long. It is not specified in detail.

- Set “module config” to 0.

ProxyAssem6 is module’s “safe state” data. It consists of the same size, specified as a bit-field of 16 Bits. For all these bits we take default settings, they’re all zeros. That does mean that "Point ‘i’ Safe State On/Off" default setting is “off”.

Consult 1794-OB16/A users manual for the details.

- Set in Cfg.#2 module config. 16 Bits and module safe state 16 Bits as follows:

```
... 
00 00 Cfg.#2, module cfg
00 00 Cfg.#2, module flags
```

- In the example here the Cfg.#2 data segment value then is “0200 0000 0000”. 
5 Appendix

5.1 User Rights

User rights are set within the FDT-container. Depending on the level the configuration is accessible by the user or read-only.

To access the Configuration panes of the EtherNet/IP Generic Adapter DTM you do not need special user rights. Also all users can select the decimal or hexadecimal Display mode or sort table entries.

**Note:** To edit, set or configure the parameters of the Configuration panes, you need user rights for Maintenance, for Planning Engineer or for Administrator.

The following tables give an overview of the user right groups and which user rights you need to configure the single parameters.

### 5.1.1 Configuration

5.5 Glossary

Assembly
- Connection Point

CIP
- Common Industrial Protocol (Control and Information Protocol)

DHCP
- Dynamic Host Configuration Protocol

DNS
- Domain Name Service.

DTM
- Device Type Manager.
  The Device Type Manager (DTM) is a software module with graphical user interface for the configuration or for diagnosis of device.

EDS
- An Electronic Data Sheet (EDS) provides information necessary to access and alter the configurable parameters of a device. An Electronic Data Sheet (EDS) is an external file that contains information for the device.

EtherNet/IP
- EtherNet/Industrial Protocol (CIP on Ethernet)

EtherNet/IP Scanner
- A Scanner exchanges real-time I/O data with Adapters and Scanners. This type of node can respond to connection requests and can also initiate connections on its own.

EtherNet/IP-Adapter
- An Adapter emulates functions provided by traditional rack-adapter products. This type of node exchanges real-time I/O data with a Scanner Class product. It does not initiate connections on its own.

FDT
- Field Device Tool
  FDT specifies an interface, in order to be able to use DTM (Device Type Manager) in different applications of different manufacturers.

TCP/IP
- Transmission Control Protocol / Internet Protocol

UDP
- User Datagram Protocol
